Inference in first-order logic

Chapter 9

Outline

- ♦ Reducing first-order inference to propositional inference
- ♦ Unification
- ♦ Generalized Modus Ponens
- ♦ Forward and backward chaining
- ♦ Logic programming
- ♦ Resolution

Universal instantiation (UI)

Every instantiation of a universally quantified sentence is entailed by it:

$$\frac{\forall v \ \alpha}{\text{SUBST}(\{v/g\}, \alpha)}$$

for any variable v and ground term g

```
E.g., \forall x \; King(x) \land Greedy(x) \Rightarrow Evil(x) \; \text{yields} King(John) \land Greedy(John) \Rightarrow Evil(John) \\ King(Richard) \land Greedy(Richard) \Rightarrow Evil(Richard) \\ King(Father(John)) \land Greedy(Father(John)) \Rightarrow Evil(Father(John)) \\ \vdots
```

Existential instantiation (EI)

For any sentence α , variable v, and constant symbol k that does not appear elsewhere in the knowledge base:

$$\frac{\exists v \ \alpha}{\text{SUBST}(\{v/k\}, \alpha)}$$

E.g., $\exists x \ Crown(x) \land OnHead(x, John)$ yields

$$Crown(C_1) \wedge OnHead(C_1, John)$$

provided C_1 is a new constant symbol, called a Skolem constant

Existential instantiation contd.

UI can be applied several times to *add* new sentences; the new KB is logically equivalent to the old

El can be applied once to *replace* the existential sentence; the new KB is *not* equivalent to the old, but is satisfiable iff the old KB was satisfiable

Reduction to propositional inference

Suppose the KB contains just the following:

```
\forall x \ King(x) \land Greedy(x) \Rightarrow Evil(x)

King(John)

Greedy(John)

Brother(Richard, John)
```

Instantiating the universal sentence in all possible ways, we have

```
King(John) \wedge Greedy(John) \Rightarrow Evil(John)

King(Richard) \wedge Greedy(Richard) \Rightarrow Evil(Richard)

King(John)

Greedy(John)

Brother(Richard, John)
```

The new KB is propositionalized: proposition symbols are

King(John), Greedy(John), Evil(John), King(Richard) etc.

Reduction contd.

Claim: a ground sentence* is entailed by new KB iff entailed by original KB

Claim: every FOL KB can be propositionalized so as to preserve entailment

Idea: propositionalize KB and query, apply resolution, return result

Problem: with function symbols, there are infinitely many ground terms, e.g., Father(Father(Father(John)))

Theorem: Herbrand (1930). If a sentence α is entailed by an FOL KB, it is entailed by a *finite* subset of the propositional KB

Idea: For n=0 to ∞ do create a propositional KB by instantiating with depth-n terms see if α is entailed by this KB

Problem: works if α is entailed, loops if α is not entailed

Theorem: Turing (1936), Church (1936), entailment in FOL is semidecidable

Problems with propositionalization

Propositionalization seems to generate lots of irrelevant sentences. E.g., from

```
\forall x \ King(x) \land Greedy(x) \Rightarrow Evil(x)
King(John)
\forall y \ Greedy(y)
Brother(Richard, John)
```

it seems obvious that Evil(John), but propositionalization produces lots of facts such as Greedy(Richard) that are irrelevant

With p k-ary predicates and n constants, there are $p \cdot n^k$ instantiations!

$$\theta = \{x/John, y/John\}$$
 works

Unify(
$$\alpha, \beta$$
) = θ if $\alpha \theta = \beta \theta$

p	q	$\mid heta \mid$
	[Knows(John,Jane)]	
Knows(John, x)	Knows(y, OJ)	
Knows(John, x)	Knows(y, Mother(y))	
Knows(John,x)	Knows(x, OJ)	

$$\theta = \{x/John, y/John\}$$
 works

Unify(
$$\alpha, \beta$$
) = θ if $\alpha \theta = \beta \theta$

p	q	heta
$\overline{Knows(John,x)}$	[Knows(John,Jane)]	$\{x/Jane\}$
Knows(John, x)	Knows(y, OJ)	
Knows(John, x)	ig Knows(y,Mother(y))ig	
Knows(John, x)	Knows(x, OJ)	

$$\theta = \{x/John, y/John\}$$
 works

Unify(
$$\alpha, \beta$$
) = θ if $\alpha \theta = \beta \theta$

p	q	$\mid heta \mid$
$\overline{Knows(John,x)}$	Knows(John, Jane)	$\{x/Jane\}$
Knows(John, x)	Knows(y, OJ)	$\{x/OJ, y/John\}$
Knows(John, x)	Knows(y, Mother(y))	
Knows(John,x)	ig Knows(x,OJ)	

$$\theta = \{x/John, y/John\}$$
 works

Unify(
$$\alpha, \beta$$
) = θ if $\alpha \theta = \beta \theta$

p	q	heta
, , ,	\	$\{x/Jane\}$
Knows(John, x)	Knows(y, OJ)	$\{x/OJ, y/John\}$
Knows(John, x)	Knows(y, Mother(y))	$\{y/John, x/Mother(John)\}$
Knows(John,x)	Knows(x, OJ)	

We can get the inference immediately if we can find a substitution θ such that King(x) and Greedy(x) match King(John) and Greedy(y)

$$\theta = \{x/John, y/John\}$$
 works

Unify(
$$\alpha, \beta$$
) = θ if $\alpha \theta = \beta \theta$

p	q	heta
$\overline{Knows(John,x)}$	Knows(John, Jane)	$\{x/Jane\}$
Knows(John, x)	Knows(y, OJ)	$\{x/OJ, y/John\}$
Knows(John, x)	ig Knows(y,Mother(y))ig	$\{y/John, x/Mother(John)\}$
Knows(John,x)	ig Knows(x,OJ)	fail

Standardizing apart eliminates overlap of variables, e.g., $Knows(z_{17},OJ)$

Generalized Modus Ponens (GMP)

$$\frac{p_1',\ p_2',\ \dots,\ p_n',\ (p_1\wedge p_2\wedge\dots\wedge p_n\Rightarrow q)}{q\theta} \qquad \text{where } p_i'\theta=p_i\theta \text{ for all } i$$

$$p_1' \text{ is } King(John) \qquad p_1 \text{ is } King(x)$$

$$p_2' \text{ is } Greedy(y) \qquad p_2 \text{ is } Greedy(x)$$

$$\theta \text{ is } \{x/John,y/John\} \ q \text{ is } Evil(x)$$

$$q\theta \text{ is } Evil(John)$$

GMP used with KB of definite clauses (*exactly* one positive literal) All variables assumed universally quantified

Soundness of GMP

Need to show that

$$p_1', \ldots, p_n', (p_1 \wedge \ldots \wedge p_n \Rightarrow q) \models q\theta$$

provided that $p_i'\theta = p_i\theta$ for all i

Lemma: For any definite clause p, we have $p \models p\theta$ by UI

1.
$$(p_1 \wedge \ldots \wedge p_n \Rightarrow q) \models (p_1 \wedge \ldots \wedge p_n \Rightarrow q)\theta = (p_1 \theta \wedge \ldots \wedge p_n \theta \Rightarrow q\theta)$$

2.
$$p_1', \ldots, p_n' \models p_1' \land \ldots \land p_n' \models p_1' \theta \land \ldots \land p_n' \theta$$

3. From 1 and 2, $q\theta$ follows by ordinary Modus Ponens

Example knowledge base

The law says that it is a crime for an American to sell weapons to hostile nations. The country Nono, an enemy of America, has some missiles, and all of its missiles were sold to it by Colonel West, who is American.

Prove that Col. West is a criminal

... it is a crime for an American to sell weapons to hostile nations:

... it is a crime for an American to sell weapons to hostile nations:

 $American(x) \land Weapon(y) \land Sells(x,y,z) \land Hostile(z) \Rightarrow Criminal(x)$

Nono . . . has some missiles

... it is a crime for an American to sell weapons to hostile nations: $\underbrace{American(x) \land Weapon(y) \land Sells(x,y,z) \land Hostile(z) \Rightarrow Criminal(x)}_{Nono \dots \text{ has some missiles, i.e., }} \exists x \ Owns(Nono,x) \land Missile(x): \\ \underbrace{Owns(Nono,M_1)}_{Owno,M_1) \text{ and }} \underbrace{Missile(M_1)}_{Missiles}$... all of its missiles were sold to it by Colonel West

... it is a crime for an American to sell weapons to hostile nations: $American(x) \land Weapon(y) \land Sells(x,y,z) \land Hostile(z) \Rightarrow Criminal(x)$ Nono ... has some missiles, i.e., $\exists x \ Owns(Nono,x) \land Missile(x)$: $Owns(Nono,M_1) \text{ and } Missile(M_1)$... all of its missiles were sold to it by Colonel West $\forall x \ Missile(x) \land Owns(Nono,x) \Rightarrow Sells(West,x,Nono)$ Missiles are weapons:

... it is a crime for an American to sell weapons to hostile nations:

 $American(x) \land Weapon(y) \land Sells(x, y, z) \land Hostile(z) \Rightarrow Criminal(x)$

Nono . . . has some missiles, i.e., $\exists x \ Owns(Nono, x) \land Missile(x)$:

 $Owns(Nono, M_1)$ and $Missile(M_1)$

... all of its missiles were sold to it by Colonel West

 $\forall x \; Missile(x) \land Owns(Nono, x) \Rightarrow Sells(West, x, Nono)$

Missiles are weapons:

 $Missile(x) \Rightarrow Weapon(x)$

An enemy of America counts as "hostile":

```
... it is a crime for an American to sell weapons to hostile nations:
   American(x) \land Weapon(y) \land Sells(x, y, z) \land Hostile(z) \Rightarrow Criminal(x)
Nono . . . has some missiles, i.e., \exists x \ Owns(Nono, x) \land Missile(x):
   Owns(Nono, M_1) and Missile(M_1)
... all of its missiles were sold to it by Colonel West
   \forall x \; Missile(x) \land Owns(Nono, x) \Rightarrow Sells(West, x, Nono)
Missiles are weapons:
   Missile(x) \Rightarrow Weapon(x)
An enemy of America counts as "hostile":
   Enemy(x, America) \Rightarrow Hostile(x)
West, who is American . . .
   American(West)
The country Nono, an enemy of America . . .
   Enemy(Nono, America)
```

Forward chaining algorithm

```
function FOL-FC-Ask(KB, \alpha) returns a substitution or false
   repeat until new is empty
         new \leftarrow \{ \}
         for each sentence r in KB do
               (p_1 \land \ldots \land p_n \Rightarrow q) \leftarrow \text{STANDARDIZE-APART}(r)
               for each \theta such that (p_1 \land \ldots \land p_n)\theta = (p'_1 \land \ldots \land p'_n)\theta
                                for some p'_1, \ldots, p'_n in KB
                     q' \leftarrow \text{SUBST}(\theta, q)
                   if q' is not a renaming of a sentence already in KB or new then do
                          add q' to new
                          \phi \leftarrow \text{UNIFY}(q', \alpha)
                          if \phi is not fail then return \phi
         add new to KB
   return false
```

Forward chaining proof

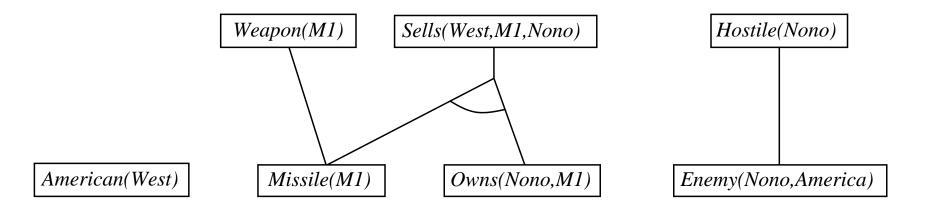

American(West)

Missile(M1)

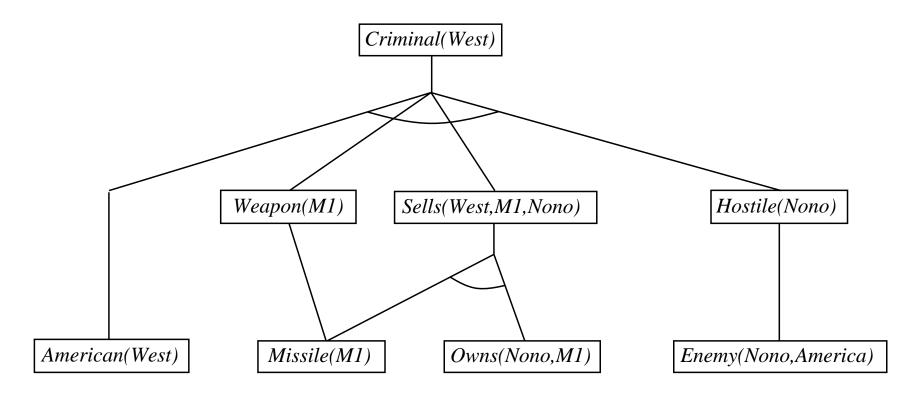

Owns(Nono,M1)

Enemy(Nono,America)

Forward chaining proof

Forward chaining proof

Properties of forward chaining

Sound and complete for first-order definite clauses (proof similar to propositional proof)

Datalog = first-order definite clauses + no functions (e.g., crime KB) FC terminates for Datalog in poly iterations: at most $p \cdot n^k$ literals

May not terminate in general if α is not entailed

This is unavoidable: entailment with definite clauses is semidecidable

Efficiency of forward chaining

Simple observation: no need to match a rule on iteration k if a premise wasn't added on iteration k-1

⇒ match each rule whose premise contains a newly added literal

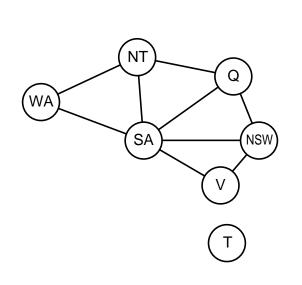

Matching itself can be expensive

Database indexing allows O(1) retrieval of known facts e.g., query Missile(x) retrieves $Missile(M_1)$

Matching conjunctive premises against known facts is NP-hard

Forward chaining is widely used in deductive databases

Hard matching example

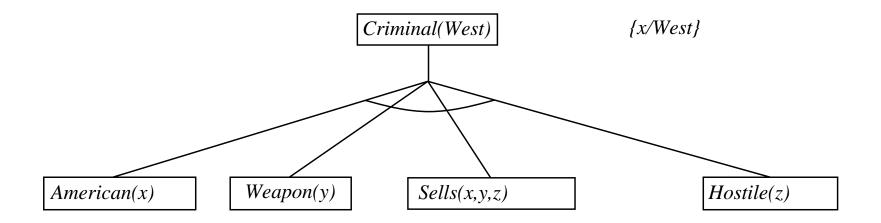

$$Diff(wa, nt) \land Diff(wa, sa) \land$$
 $Diff(nt, q)Diff(nt, sa) \land$
 $Diff(q, nsw) \land Diff(q, sa) \land$
 $Diff(nsw, v) \land Diff(nsw, sa) \land$
 $Diff(v, sa) \Rightarrow Colorable()$
 $Diff(Red, Blue) \quad Diff(Red, Green)$
 $Diff(Green, Red) \quad Diff(Green, Blue)$
 $Diff(Blue, Red) \quad Diff(Blue, Green)$

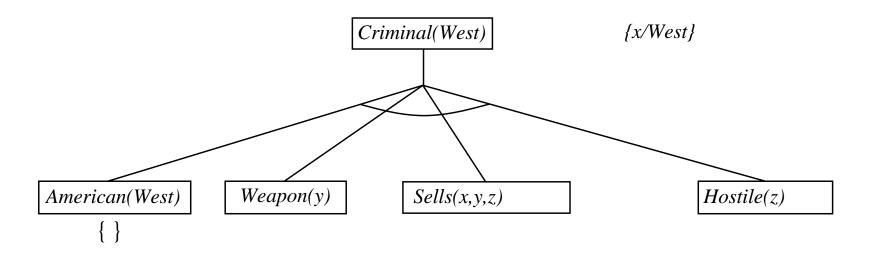

Colorable() is inferred iff the CSP has a solution CSPs include 3SAT as a special case, hence matching is NP-hard

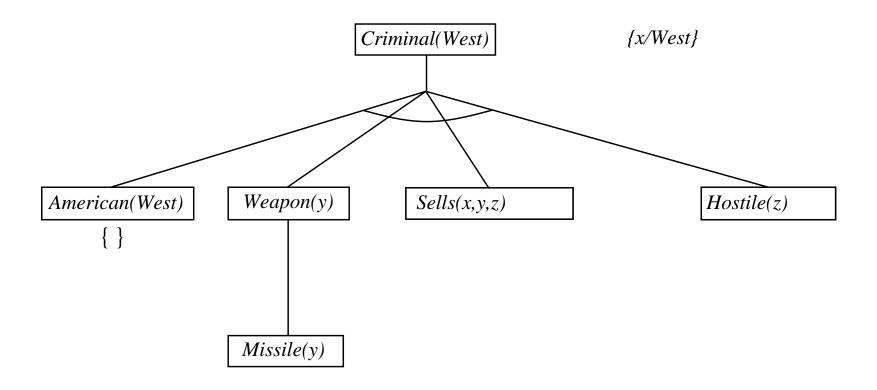

Backward chaining algorithm

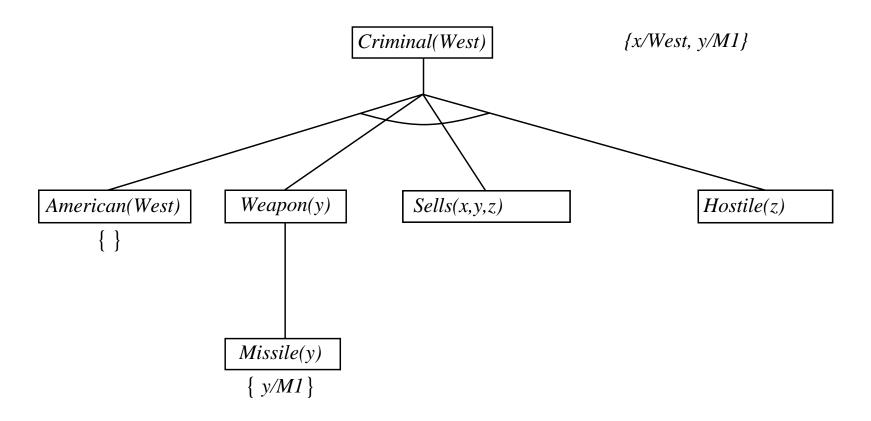

```
function FOL-BC-Ask(KB, goals, \theta) returns a set of substitutions inputs: KB, a knowledge base goals, a list of conjuncts forming a query \theta, the current substitution, initially the empty substitution \{\} local variables: ans, a set of substitutions, initially empty if goals is empty then return \{\theta\} q' \leftarrow \text{SUBST}(\theta, \text{FIRST}(goals)) for each r in KB where STANDARDIZE-APART(r) = (p_1 \land \ldots \land p_n \Rightarrow q) and \theta' \leftarrow \text{UNIFY}(q, q') succeeds ans \leftarrow \text{FOL-BC-Ask}(KB, [p_1, \ldots, p_n| \text{REST}(goals)], \text{Compose}(\theta', \theta)) \cup ans return ans
```

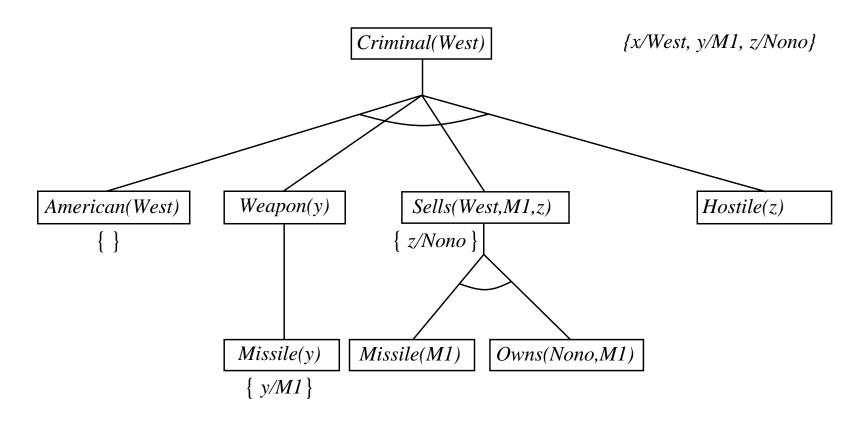

Criminal(West)

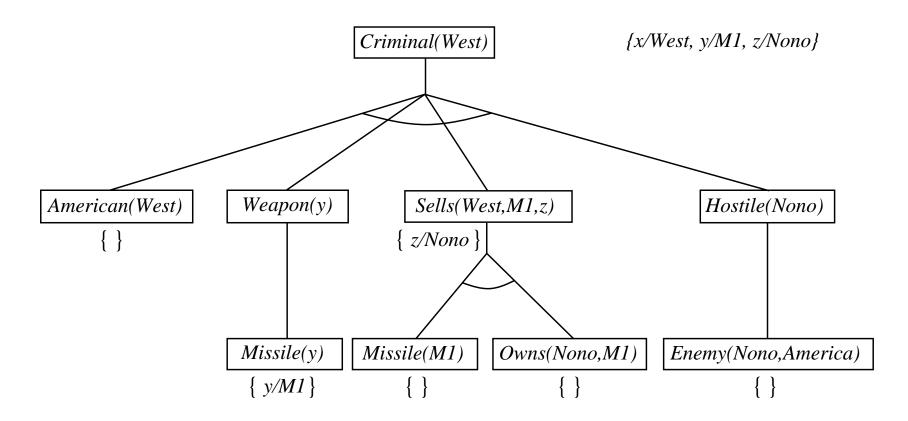

Properties of backward chaining

Depth-first recursive proof search: space is linear in size of proof

Incomplete due to infinite loops

⇒ fix by checking current goal against every goal on stack

Inefficient due to repeated subgoals (both success and failure)

⇒ fix using caching of previous results (extra space!)

Widely used (without improvements!) for logic programming

Logic programming: computation as inference on logical KBs

Prolog systems

```
Basis: backward chaining with Horn clauses + bells & whistles
Widely used in Europe, Japan (basis of 5th Generation project)
Program = set of clauses = head :- literal<sub>1</sub>, ... literal<sub>n</sub>.
   criminal(X) := american(X), weapon(Y), sells(X,Y,Z), hostile(Z).
Efficient unification by open coding
Efficient retrieval of matching clauses by direct linking
Depth-first, left-to-right backward chaining
Built-in predicates for arithmetic etc., e.g., X is Y*Z+3
Closed-world assumption ("negation as failure")
   e.g., given alive(X) :- not dead(X).
   alive(joe) succeeds if dead(joe) fails
```

Prolog example

Appending two lists to produce a third:

Resolution: brief summary

Full first-order version:

$$\frac{\ell_1 \vee \dots \vee \ell_k, \quad m_1 \vee \dots \vee m_n}{(\ell_1 \vee \dots \vee \ell_{i-1} \vee \ell_{i+1} \vee \dots \vee \ell_k \vee m_1 \vee \dots \vee m_{j-1} \vee m_{j+1} \vee \dots \vee m_n)\theta}$$

where UNIFY $(\ell_i, \neg m_j) = \theta$.

For example,

$$\frac{\neg Rich(x) \lor Unhappy(x)}{Rich(Ken)}$$
$$\frac{Unhappy(Ken)}{}$$

with
$$\theta = \{x/Ken\}$$

Apply resolution steps to $CNF(KB \land \neg \alpha)$; complete for FOL

Conversion to CNF

Everyone who loves all animals is loved by someone:

$$\forall x \ [\forall y \ Animal(y) \Rightarrow Loves(x,y)] \Rightarrow [\exists y \ Loves(y,x)]$$

1. Eliminate biconditionals and implications

$$\forall x \ [\neg \forall y \ \neg Animal(y) \lor Loves(x,y)] \lor [\exists y \ Loves(y,x)]$$

2. Move \neg inwards: $\neg \forall x, p \equiv \exists x \neg p, \neg \exists x, p \equiv \forall x \neg p$:

Conversion to CNF contd.

3. Standardize variables: each quantifier should use a different one

$$\forall x \ [\exists y \ Animal(y) \land \neg Loves(x,y)] \lor [\exists z \ Loves(z,x)]$$

4. Skolemize: a more general form of existential instantiation.

Each existential variable is replaced by a Skolem function of the enclosing universally quantified variables:

$$\forall x \ [Animal(F(x)) \land \neg Loves(x, F(x))] \lor Loves(G(x), x)$$

5. Drop universal quantifiers:

$$[Animal(F(x)) \land \neg Loves(x, F(x))] \lor Loves(G(x), x)$$

6. Distribute ∨ over ∧:

$$[Animal(F(x)) \lor Loves(G(x), x)] \land [\neg Loves(x, F(x)) \lor Loves(G(x), x)]$$

Resolution proof: definite clauses
